

## What's New in StarLog Version 8.6.0

### Version 8.6.0 – February 24, 2022

This version of the StarLog suite contains several minor enhancements and fixes.

#### Windows Support

Support has been added for Windows 11.

#### Enhancements

- #1669 **Editing text blocks** (e.g., geological descriptions): Edit text size now matches zoomed text size; F2 puts the selected text block into edit mode and positions the insertion point at the end; Alt+Enter inserts a line break.
- #1670 Verdana is now the default font for text layers in new logs.

#### Problems Fixed

- #1672 Right clicking in the track headings of some logs would cause a coordinate overflow error message.
- #1674 Selecting a graphic (e.g., text block, symbol, image) at one end of a log and using the Home or End key to move to the other end of the log triggered a redraw loop in some logs.

#### Compatibility

- This version can open earlier log files.
- Versions 8.6.0 and newer of the same program can open log files saved by this version.
